## Revision history

Revision	Date	Description
A	February 2016	Initial release
B	August 2015	Numerous changes in Chapter 2; Updated Section 4.1, Table 4.1, and Table A.1
C	August 2015	Numerous changes in Chapter 2
D	November 2015	Added Appendix A; Numerous changes in Chapter 4
E	June 2016	Numerous changes in chapter 2; Updated tables in Sections 4.2.1, 4.2.2, and 4.2.3

# 1 Introduction

---

## 1.1 Purpose

This document provides current consumption data for the MSM8996 device and software. The consumption is highly dependent on software optimization.

This document is intended for engineers and managers who are currently using or are planning to use the MSM8996 device and/or software.

Information provided in this document is subject to change and comments are provided for informational use only. No commitments are expressed or implied.

## 1.2 Expectations

### 1.2.1 Device variation

Current consumption measurements recorded in this document are measured on QTI reference hardware and hence may not match current consumption measurements of a customer design.

Variations in measurement compared to the customer device can be caused by the CDP using different components than the customer design, e.g., memory ICs, display ICs, peripheral ICs, etc. Potential variations in measurement compared to an identical CDP loaded with identical software are caused by normal silicon process variations in Qualcomm Technologies, Inc. (QTI) and non-QTI components and power-supply tolerances. Differences in measurement technique, equipment, or temperature also cause variations. Other factors such as floating CMOS inputs or taking measurements at maximum Tx power can affect the reliability and repeatability of current consumption measurements.

Targets and measurements contained herein are typical values measured on a single CDP in a lab bench environment (room temperature). They are provided as a relative reference point, not as an absolute goal to attain.

### 1.2.2 Test-case selection

The test cases selected for measurement in this document are intended to provide a wide range of coverage. Although the specific conditions a customer needs may not appear in this list, generally there is a test case or combination of test cases that is close enough to the customer requirement to be used for a baseline comparison.

## 1.3 Customer-platform power optimization

Customer-platform power optimization is best started with comparisons to the QTI platform under one or more baseline test conditions given in this document. After the customer platform and CDP8996 platform are compared and optimized in this known test case, differences between the baseline and required test cases can be measured on the customer platform and analyzed with QTI for optimization, if necessary.

Power optimization of a customer platform is an iterative process that involves the following:

- Identifying power consumption differences between a customer platform and QTI platform in similar test conditions
- Determining the source of those differences, which could be test conditions, hardware-configuration differences, software-control differences, etc.
- Deciding whether the source is an error that must be corrected or is intentional
- Correcting errors that are identified
- Repeating until all differences are corrected or determined to be intentional

As customers update their hardware platform or integrate new software releases from QTI, power consumption may change, triggering additional power optimization. It is important to understand that during the software development process, current consumption for some test cases may increase, as power improvement features may need to be delayed to a later release to meet stability requirements. Figure 1-1 is a representation of customer power consumption vs CDP power consumption.

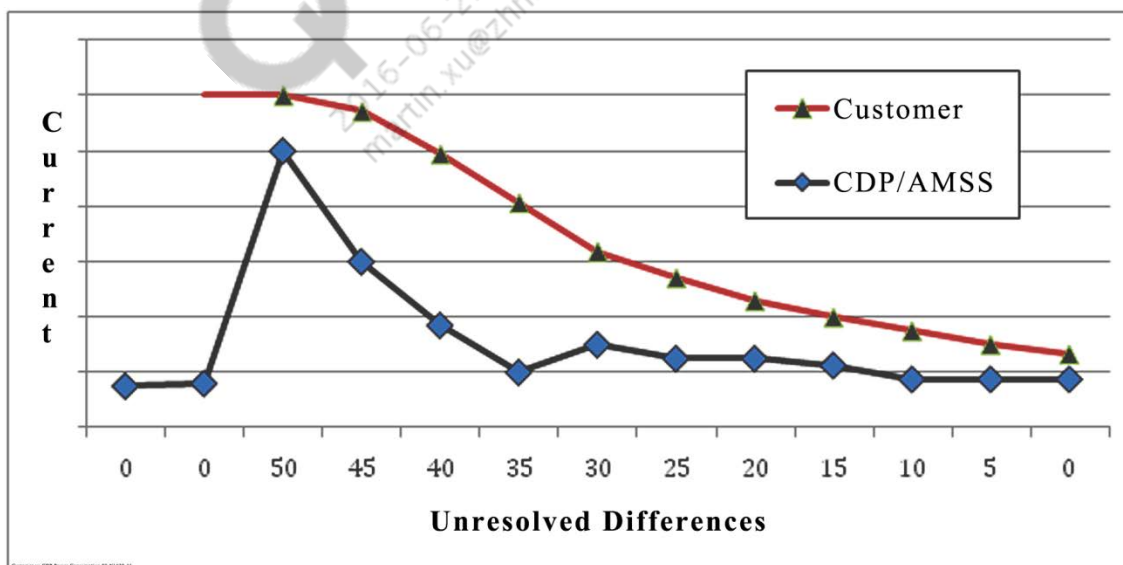

Figure 1-1 Representation of customer vs CDP power consumption

When discussing power optimization with QTI, provide as much information as possible, including the following:

- Specific test conditions
- Available history of power measurements for these test conditions
- Goals for power optimization
- Recent hardware or software changes that may have affected power consumption
- Power consumption breakdown per voltage rail, if possible

## 1.4 Publication timeline for power measurement data

This document will be updated approximately monthly with the latest available current consumption goals and battery-level measurements. Following the Feature-Complete (FC) software release, key power-rail breakdowns will be included as they become available. Measurement of these power-rail breakdowns will depend upon customer requests for specific test cases and software releases. [Table 1-1](#) lists the publication timeline for current consumption data.

**Table 1-1 Timeline for publishing current consumption data**

Information provided	Guideline for availability
Target current consumption for commercial software release	Available at the time of hardware engineering samples
Key power-rail breakdowns for <a href="#">Table 2-1</a> test cases	Available on an as-requested basis for FC and later software releases; submit a request at <a href="https://support.cdmatech.com">https://support.cdmatech.com</a>

## 1.5 Note regarding GPIO configuration

To minimize current consumption, OEMs must configure unused GPIOs in one of the following ways:

- As output in their logic low state
- As input with their internal pull-downs enabled

In addition, any GPIO pin configured as an input that is normally driven by a peripheral device (Bluetooth®, WLAN, NFC, etc.) must be programmed with an internal pull-down when the corresponding peripheral signal is set to its high-impedance state. The GPIO should then be reprogrammed to remove the pull-down when the peripheral signal is taken out of its high-impedance state.

These steps are required to prevent unwanted oscillation or high current leakage on device pins. For additional information, see *Configuration of Input Pins During Device Sleep* (80-VN499-7).

## 1.6 Conventions

Function declarations, function names, type declarations, attributes, and code samples appear in a different font, for example, `#include`.

Code variables appear in angle brackets, for example, `<number>`.

Commands to be entered appear in a different font, for example, `copy a:*. * b:.`

Button and key names appear in bold font, for example, click **Save** or press **Enter**.

Shading indicates content that has been added or changed in this revision of the document.

## 1.7 Technical assistance

For assistance or clarification on information in this document, submit a case to Qualcomm Technologies, Inc. (QTI) at <https://createpoint.qti.qualcomm.com/>.

If you do not have access to the CDMATech Support website, register for access or send email to [support.cdmatech@qti.qualcomm.com](mailto:support.cdmatech@qti.qualcomm.com).

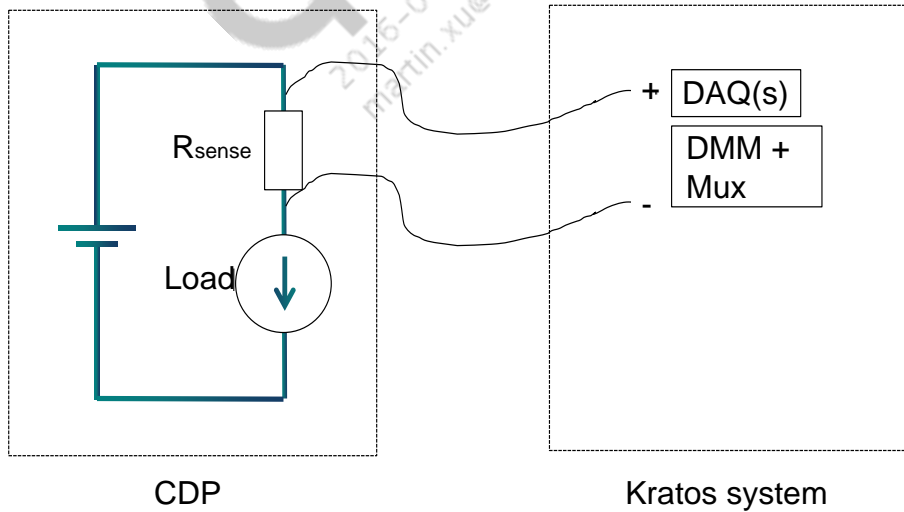

## 2 Test setup

NOTE: Numerous changes were made in this chapter.

### 2.1 Devices used for testing

The following hardware and software configurations are used for the measurements:

- MSM8996, PM8996, and PMI8994 devices are installed on the specially configured MSM8996 RCM evaluation platform for power measurement purposes only; memory configuration is 3 GB (4×6 Gbit) LPDDR4
- Current consumption measurement is performed using the QTI Kratos power measurement system on the CDP-RCM (or RCM) platform. [Figure 2-1](#) depicts the system.
- The following display resolution is used:
  - WQXGA (2560×1600), dumb panel, and Portrait mode panel orientation
  - WQXGA (2560×1600), smart panel, and Portrait mode panel orientation

**Figure 2-1 CDP-RCM and Kratos system**

Table 2-1 lists the chipset devices used on the MSM8996 power measurement platform for each set of tests. For complete list of MSM8996 device revisions, refer to *MSM8996 Device Revision Guide* (80-NT204-4). Refer to the respective Device Revision Guides for the remaining list of devices on these platforms.

**Table 2-1 Chipset ICs tested**

WTR3925
WTR4905
WSA811x

## 2.2 Air interface test equipment

Chipset current consumption is measured with the MSM8996 RCM platform configured for an air interface operating in a specific mode. The tested modes are defined in Chapter 3. The following test equipment is used to emulate the air interface:

- Most CDMA measurements – Agilent 8960 *Wireless Communications Test Set*
- Most LTE measurements – Anritsu MT8820C Radio Communication Analyzer
- Most WCDMA measurements – Agilent 8960 or the Anritsu MT8820C *Radio Communication Analyzer*
- Most GSM measurements – Agilent 8960 or the Anritsu MT8820C Radio Communication Analyzer
- Most LTE CA measurements – CMW500 Wideband Radio Communication Tester
- Most VoLTE measurements – PXT Wireless Communication Test Set

## 2.3 Power tree

The power tree for the MSM8996 chipset shows the power rails for other devices such as the QCA6174A and WCD9335, and external circuitry such as eMMC, UFS, SD card, display, camera, and sensors. The RCM channel information for the RCM-configured CDP is also shown on the power tree.

The current consumption numbers listed in the power tree are estimated worst-case currents. These numbers are preliminary and are intended for PCB routing reference only. In a real world scenario, all the loads at a node will not run concurrently with peak consumption.

- Actual currents from third-party components such as eMMC, display, camera, sensors, and so on may be different than what is shown in the grid
- For the over-current protection battery specification, refer to *PM8994/PM8996 and PMI8994/PMI8996 Power Management ICS Design Guidelines/Training Slides* (80-NJ117-5)
- For more information, refer to *Battery Current Limit (BCL) Overview and Tuning* (80-NM328-709) for more details.

## 3 Test definitions

Definitions of test conditions (air interface configuration, multimedia, display activity, lighting status, etc.) for the current consumption tests are listed in [Table 3-1](#).

**Table 3-1 Test definitions**

Test case	Code	Operating band	Definition
Airplane mode	AIR1	NA	Airplane mode is selected through the UI; if no UI support, configure modem in low power mode with no wake-ups for paging processing; backlight and display off
WCDMA (2.56s) Standby	WS1	IMT	WCDMA idle, Stationary A, Discontinuous Receive (DRx) 2.56 sec, RxAGC at phone ~ -50 dBm, duration 64 sec; Sintrasearch (intrafrequency) and Sintersearch (interfrequency) CPICH $E_c/I_0 < -10$ dB; backlight and display off
CDMA (5.12s) QPCH Standby	CS2	Cell	CDMA QPCH Standby mode, SCI = 2 (5.12 sec), RxAGC at phone ~ -50 dBm, single sector, no neighbors; cell band; backlight and display off
GSM (1.18s) Standby	GS1	PGSM	GPRS standby, MFRM5 (1.17 sec), RxAGC at phone ~ -50 dBm, PGSM, no neighbor, duration 59 sec; backlight and display off
LTE FDD (2.56s, 10 MHz) Standby	LS1	B13	LTE Standby mode, DRX = 2.56 sec, RxAGC at phone ~ -50 dBm, no neighbors, duration 64 sec; backlight and display off
LTE TDD Standby (2.56s, 20 MHz)	LS4	B41	LTE TDD Standby mode, DRX = 2.56s, ULDL2 (20 MHz), SSF#7, B41, Rx power level -50 dBm at phone antenna connector, measurement duration 64 sec; Sintra = 0 and Snointra = 0, no neighbor cells, backlight and display off; EPRE = -50 dbm/kHz
LTE FDD CDRX with 320 ms long CDRX cycle, 10 MHz	CDRXS1	B13	LTE FDD CDRX Standby with idle DRX = 1.28s, RxAGC at phone ~ -50 dBm; no neighbors; display/backlight is off; UE camps on CDRX with no traffic; RRC idle timer is set to a very high value to ensure RRC connection release is not sent; CQI reporting in the first subframe; 40 ms CQI reporting interval CDRX params: 320 ms long CDRX cycle; 200 ms inactivity timer; 10 ms on duration; retransmission time 2 ms; disable short_CDRX_cycle; BW, 1 MHz
TD-SCDMA (1.28s) Standby	TCS1	B34	TD-SCDMA idle Stationary A, DRX 1.28 sec, Rx power level -50 dBm at phone antenna connector, test duration 64 sec; Sintrasearch (intrafrequency) and Sintersearch (interfrequency) CPICH $E_c/I_0$ is ~ -15 dB; backlight and display off
CDMA Talk, BC0, + 0 dBm	CT1	Cell	CDMA-only mode, muted, empty frames on UL and DL, total Tx = 0 dBm, RxAGC at phone ~ -50 dBm, EVRC RC3 full rate, no headset, cell band; backlight and display off
WCDMA Talk + 0 dBm, B1	WT1	IMT	WCDMA AMR NB voice, muted; empty frames on UL and DL; total Tx 0 dBm, RxAGC at phone ~ -50 dBm; IMT; no RxD; backlight and display off; default MIC settings enabled in software

Test case	Code	Operating band	Definition
GSM Talk 5 dBm, no DTX	GT1	PGSM	GSM full-rate voice; UL muted; DTx off; empty frames on UL and DL, total Tx = 5 dBm, RxAGC at phone ~ -50 dBm, PGSM, 100% voice activity; backlight and display off
VoLTE FDD 10 MHz 0 dBm 40% voice activity + 40% listen state + 20% silent state, 40 ms CDRX, dynamic scheduling, B13	VoLTE1	B5	Embedded LTE AMR-WB full-rate voice; Tx power 0 dBm, LTE 10 MHz bandwidth, 40 ms CDRX, HARQ: 4; dynamic scheduling in UL and DL; 40% voice activity + 40% listen state + 20% silent state; backlight and display off; on-duration of 2 ms; inactivity timer of 2 ms 1. Average the power over three runs 1a. First run with 0% voice activity (play 100% VA file in the remote device, mute local device) 1b. Second run with 100% voice activity (mute remote device, play 100% VA file in the local device) 1c. Third run with 0% activity with both devices (mute remote device and local device)
VoLTE TDD 40 ms DRX, 20 MHz, + 0 dBm, B7, SP/SR-mask	VOLTE6		Embedded LTE AMR-WB full-rate voice, transmit power 0 dBm, LTE TDD 20 MHz bandwidth, UL/DL config1, SSF7, 40 ms CDRX, HARQ:4 dynamic scheduling in UL and DL, 40% voice activity + 40% listen state + 20% silent state, backlight and display off, on-duration of 2 ms, inactivity timer of 2 ms 1. Average the power over three runs 1a. First run with 0% voice activity (play 100% VA file in the remote device, mute local device) 1b. Second run with 100% voice activity (mute remote device, play 100% VA file in the local device) 1c. Third run with 0% activity with both devices (mute remote device and local device)
TD-SCDMA talk, B34	TCT1	B34	TD-SCDMA voice, muted; empty frames on UL and DL; total Tx 0 dBm; Rx power level -50 dBm at phone antenna connector; B34, backlight and display off
TD-SCDMA HSDPA 2.8 Mbps 0 dbm RXD Off	TDHS1E		TD-SCDMA HSDPA 2.8 Mbps; forced RXD off; embedded full stack call Test mode, without USB; UE Tx Pwr 0 dbm, lor at -45 dbm; channel coding HSDPA RMC; 16 QAM; VRC; backlight and display off; band A/band 34/39 (2011/1950 MHz UL/DL)
Embedded EVDO data DL 3.1 Mbps, BC0, RxD Off, 0 dBm	DD2E	Cell	EV-DO data DL at 3.1 Mbps [Rev A]; 0 dBm on UL; single carrier; Tx 0 dBm; Rx disabled; CELL band, with USB; CELL power or lor = -45 dBm, with rake receiver
HSPA+DC Cat 24 (42 Mbps DL, B1), with R99 UL; Tx at 0 dBm, Rx on; embedded	HS62E	IMT	HSPA+ Cat 24 data socket initiated through UI; R99 UL; dual carrier [42 Mbps]; UDP, 64 QAM; Rx on; IMT band
LTE FDD Cat 3 (68/23 DL/UL, B13), 0 dBm, 10 MHz	LTE1E	B13	LTE Data Cat 3, 2x2 MIMO, RB 50, MCS 28, 64 QAM, CP normal; PCFICH 3 sym, DCI 1A, Type 0, PHICH 1/6; Tx 0 dBm, Rx -45 dBm, DL spectrum bandwidth 10 MHz; backlight and display off, embedded; bi-directional data transfer (UDP)
LTE TDD Cat 3 (60/19 Mbps DL/UL, B38) 0 dBm, 20 MHz, MIMO	LTE5E	B38	LTE TDD Data Cat 3; ULDL1; SSF#7; 2x2 MIMO; RB 100; MCS 23; 64 QAM; B38; CP normal; PCFICH 3 sym; DCI 1A; Type 0; PHICH 1/6; Tx 0 dBm; DL spectrum bandwidth 20 MHz; backlight and display off; bi-directional data transfer (UDP)

Test case	Code	Operating band	Definition
LTE FDD Cat 3 (100/50 DL/UL, B7), Embedded, 0 dBm, 20 MHz bandwidth	LTE6E	B7	LTE data Cat 3, 2x2 MIMO, RB 100, MCS 23, 64 QAM, CP normal; PCFICH 3sym, DCI 1A, Type 0, PHICH 1/6, Tx 0 dBm, DL spectrum BW 20 MHz; backlight and display off; embedded
LTE FDD Cat 3 2xCA, 10 MHz + 10 MHz (100/25 DL/UL, B17tx + B4), 0 dBm	LTE8E	B4, B17	Carrier aggregation, 10 MHz bandwidth from one carrier and 10 MHz bandwidth from second carrier; each carrier uses this parameter: 2x2 MIMO, RB 50, MCS 23, 64 QAM, CP normal; PCFICH 3sym, DCI 1A, DL Res. PHICH 1/6, Tx 0 dBm, TM3; backlight and display off, LTE data socket is initiated through UI; embedded
LTE FDD Cat 6, CA, 20 MHz + 20 MHz (300/50 DL/UL, B3tx + B7), 0 dBm	LTE10E	B3, B7	Carrier aggregation, 20 MHz BW from one carrier and 20 MHz BW from second carrier; backlight and display off, LTE data socket is initiated through UI; embedded
LTE FDD Cat9, 3xCA, 20 MHz + 20 MHz + 20 MHz (450/50 DL/UL, B3 (Tx) + B7 + B20), 0 dBm	LTE21E		Carrier aggregation, 20 MHz BW from all three carriers; backlight and display off, LTE data socket is initiated through UI – Embedded, Tx at 0 dBm; RB = 100 MCS = 28
GNSS 1 Hz Trk high sensitivity + WS1	GNSS1	IMT	GLONASS standalone 1 Hz tracking high sensitivity; backlight and display off
GPS 1 Hz Trk (DPO) + WS1	GPS2	IMT	GPS standalone 1 Hz tracking (DPO); GPS standalone 1 Hz tracking in strong signal conditions; backlight and display off

## 4 Chipset current consumption

---

### 4.1 Commercial software release target values – Top-level

Commercial software release target values are predictions of the current consumption for the commercial-quality software release for an operating system. These targets will not be updated after the commercial software has been released.

Commercial software release target values for the operational modes defined within [Table 3-1](#) are listed in [Table 4-1](#). These values reflect optimized hardware and software configurations. These values are normalized to a 3.7 V supply voltage.

The current ranges shown in [Table 4-1](#) are projections of the current that is expected to be drained from the battery during each use case. These current ranges are the projected power consumption for a typical device (50<sup>th</sup> percentile) and a device at the 95<sup>th</sup> percentile of the device distribution. Devices that fall outside this range are to be expected. For maximum power specifications, QTI provides a power limit for AP Dhrystone power and sleep power of the VDD\_CORE and VDD\_MEM voltage rails. See *MSM8996 Device Specification* (80-NT204-1) for details.

The 14nm manufacturing process variation across parts lead to a power distribution. The exact shape and median of this distribution is expected to vary over time with the maturing of the 14nm process.

**Table 4-1 Commercial software release current consumption targets (in mA at 3.7 V)**

	Test case	Code	Tj (C)	MSM8996 CS goal WQXGA dumb panel 3 GB – LPDDR4 (50%ile to 95%ile)	MSM8996 CS goal WQXGA smart panel 3 GB – LPDDR4 (50%ile to 95%ile)
<b>Modem</b>	Airplane mode	AIR1*	25	3.07 to 3.72	3.07 to 3.72
	WCDMA (2.56s) Standby	WS1	25	3.46 to 4.19	3.46 to 4.19
	CDMA (5.12s) QPCH Standby	CS2	25	3.36 to 4.07	3.36 to 4.07
	GSM (1.18s) Standby	GS1	25	3.76 to 4.55	3.76 to 4.55

<b>Note:</b> <ul style="list-style-type: none"> <li>The CS goals in the table exclude display panel, touch, and camera sensor current consumption.</li> <li>The power dashboard is based on a UFS configuration but does not include the power of the memory storage itself (only the controller and PHY are included).</li> <li>AIR1 and all Use Cases defined on top of it include 1.47 mA LPDDR4 memory self-refresh power.</li> </ul>					

## 4.2 Breakdown measurements per regulator values

This section shows breakdown data for dashboard use cases based on the MSM8996 chipset with 3 GB LPDDR4 configuration. The software release version is 1600.

### 4.2.1 Modem breakdown data

NOTE: The following tables have been updated.

**Table 4-2 Airplane mode**

# A MSM8996 AP Dhrystone curves

Figure A-1 shows TT parts (~7.5 mW) quad Dhrystone power curves.

Figure A-1 Qualcomm Kryo™ Dhrystone single core power vs. DMIPS

Figure A-2 and Figure A-3 show power vs. DMIPS at the given temperatures. The Kryo junction temperature is regulated at the given temperature while this measurement is performed. LVT curves are slightly overlapping between 85°C and 95°C due to ~5-10 mV lower voltage at 95°C.

**Figure A-2 Kryo Dhrystone single core power vs. DMIPS and junction temperature (Silver vs. Tj)**

**Figure A-3 Kryo Dhrystone single core power vs. DMIPS and junction temperature (Gold vs. Tj)**
